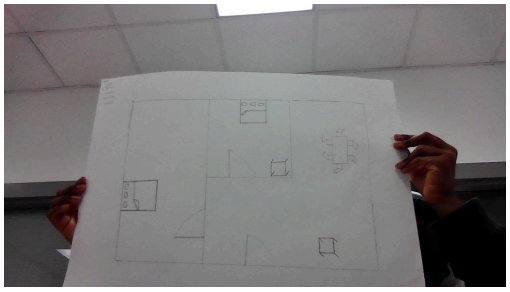
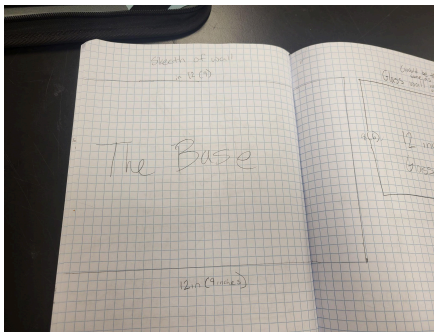
Design Element # 1 The Base

The base of the project house we are going to build is entirely out of 8x12 cardboard using a boxcutter and scissors and we start by measuring with a plastic ruler with a length of 12 inches and a width 8 inch and cut it out with a boxcutter this base should be big enough for it to fit two rooms

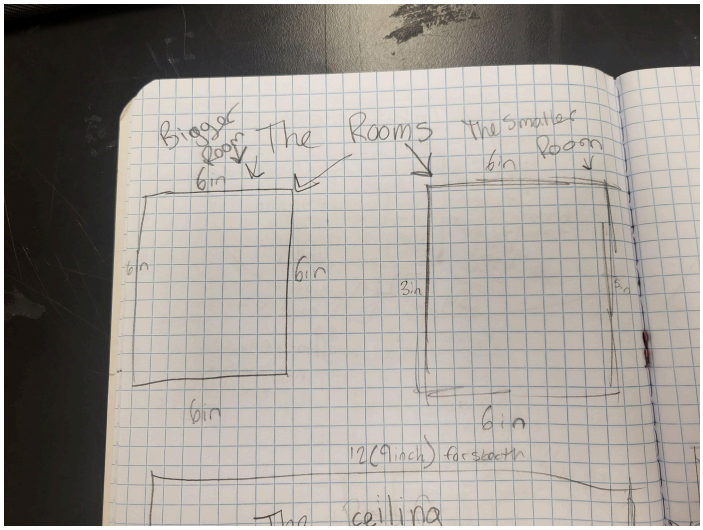


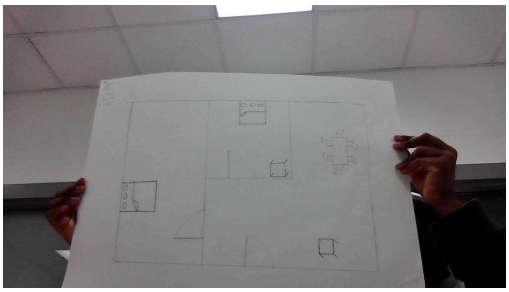


Since the sketch was on the journal we divided the inches by two to get smaller numbers to fit on the page (12 divide by 2 =9 8 divided by 2 =6)

Design Element #2 The Rooms

The rooms were very specific to the stakeholder there are two rooms in the house one small room and one huge room, for the bigger room use the 8x12 carbroard to measure with a ruler with a length of 6 inches and width of 6 also and so the small room 6 inches length and 3 inches width. We glue the two rooms in the places as its in the template.

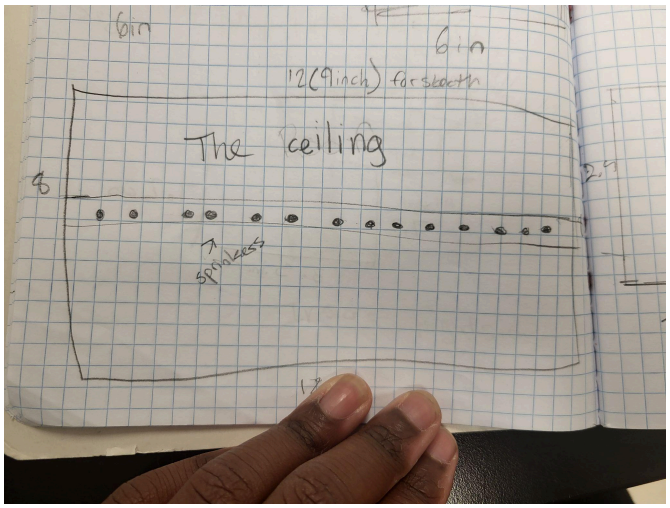




I Draw two squares measuring their lengths and widths (in the picture)

Design Element #3 The Ceiling

The ceiling is the same measurements as the base since is supposed to cover the house and of course, we used 8x12 cardboard and hot glue to glue on top of the house but started brainstorming by adding additional sprinklers.



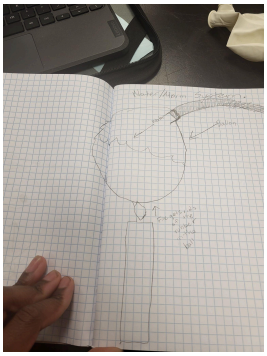
Our original plan was to use the a clear pipe and that’s hooks on to a cup of water and with a fire sensor it was going to be able to detect the fire using red light and we will activate the sprinkler.

Design #4 Doors

Using the 8x12 cardboard we cut out a door and measured the length of 6.5 inches and width of 2.5 inches 
Design 5 The Furnture

All the designs you see in the pictures were made with 8x12 cardboard and construction paper such as color as purple and orange for the beds and for the pillow for the furniture pink and the tv all glued together by hot glue by using scissors to cut separate pieces

The legs of the bed are measured 2cm each for the leg of the bed and the mattress is 2 inches (same measurement as the other furniture)

Design #6 Water suppression system


We use pale white water balloons and use water(any kind of water) to fill the balloon up with water and stick the balloon up the roof with tape and let it stick there until a fire would starts.
