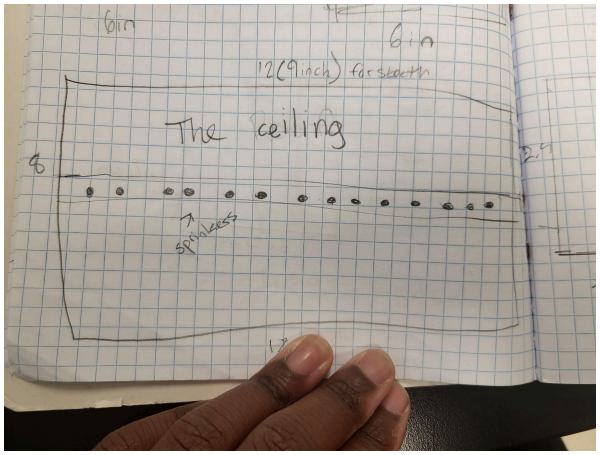
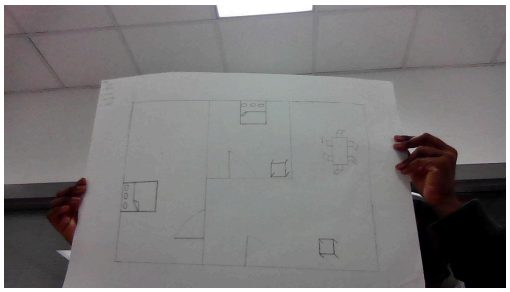
The Process for Generating Solutions

The suppression system was supposed to be a a tube with a holes coming down to cup water



The base of the project house we are going to build is entirely out of 8x12 cardboard using a boxcutter and scissors and we start by measuring with a plastic ruler with a length of 12 inches and a width 8 inch and cut it out with a boxcutter this base should be big enough for it to fit two rooms



We have integrate the parts using the 8x12 cardboard and rules to measure each parts of each piece of the a object from the smallest to the biggest and assemble them using hot glue and glue stick all provided from the school. Along with some construction paper. Which costs about nothing since it’s from the school.

These prototypes are for the stakeholders and for the people who want to see an identical look of the house and to let the people know that this prototype is a house with house stuff in it.
