

ELEMENT H

- We measured to see how much weight our motors could pull/lift, the first motor could only lift around 1 pound, our second motor could pull much more weight around 3-5 pounds and had much more torque.
- We weighed the roofs because our motors couldn't lift the wooden roof as it weighed way too much, so we switched to a light plastic like material that the motors had no issue lifting and holding.
- We used one 6 volt battery at first which didn't give us enough torque in order to lift the roof so we added it up and realized we need to add another battery so we now have 2 6 volt batteries and plenty of torque and power to lift the roof.
- We measured the required black tray we were given in order to insure that it was 10 by 20 inches. It meets the requirements.
