

Element B:

Documentation and Analysis of Prior Design Attempts

PAST INNOVATIONS

In the past to address blindspots, people have used specialized mirrors and domes. These things are used to eradicate the possibility of blindspots sometimes in warehouses or stores. They help increase visibility when it comes to places like intersections, retail aisle corners, and areas where collisions might happen, (forklifts and employees).

The class has not done anything in the past to address the issue. However, the class is currently working on finalizing a design for the solution. Nobody else addressed this issue in the past within this school. However, people have thought about using mirrors to help the librarian see blind spots in the library.

The librarian has had to physically get up and walk around the library in order to check on her students. This does allow her to see her students, but it isn't too effective as she cannot see all the students at once. The prototype could give the librarian the ability to see blind spots without having to put out too much physical energy.
