

ELEMENT B

Korni's Element B: [Why Dr. Dish](#)

This basketball dispenser can give us an idea of what we need to make. It allows us to understand what is needed to create a ball dispenser. The technology they use to create this dispenser can help us figure out how to make our own at a cheaper cost. This dispenser would not work for the lacrosse balls because it is engineered to fit basketballs. The basketball dispenser is designed to shoot out balls of that size, density, and material. This wouldn't work for lacrosse balls because lacrosse balls are completely different from basketballs. Our design is meant to fit the size and material of a lacrosse ball to properly help the lacrosse team.

Gabby's Element B: [ECONOMIC BALL DISPENSER](#)

This golf ball dispenser is an example of our solution. It gives a sample shape and structure of a stationary ball dispenser. This gives us an idea of how our dispenser should look in terms of size and the positioning of certain features, specifically the dispenser itself. However, we wouldn't be able to implement this design because it is intended for golf balls, which aren't the same size and material as lacrosse balls. Also, this dispenser is significantly more expensive than our ideal dispenser and likely would be out of price range for our stakeholders. But, it is still a useful design and will help us in developing our own solution.

Max's Element B: [PowerNet Launch F-lite Baseball and Softball Pitching Machine](#)

This baseball and softball pitching machine is an example of what our group envisioned when trying to create our lacrosse ball dispenser. With this source, we are able to get an idea of what we have to create along with the materials that go into the product and the general price of what a product like this must cost to be manufactured. Due to baseballs and softballs being slightly smaller in size compared to lacrosse balls, this certain type of dispenser wouldn't work for lacrosse balls as this particular dispenser isn't designed for larger balls. The design that we've made and created a 3D model for specifically is made to fit the size of a lacrosse ball to properly help the lacrosse team.

Preston's Element B: [Ready Set Fetch Automatic Disc Launcher Dog Toy](#)

A frisbee launcher could be tweaked to create a lacrosse ball dispenser by modifying its design and mechanics. The launcher's ability to project objects with speed can be copied to dispense lacrosse balls as well. By incorporating a mechanism to hold and dispense the ball, our group can create a wooden dispenser that shoots out balls effectively for practice sessions. This offers a cost-effective and innovative solution for the distribution of lacrosse balls at ERHS Boys Lacrosse practice, assisting in drills and the simulation of live gameplay.
