

1. They first tried to solve this by buying a very big water bucket to reduce the amount of times it would need to be filled. Other solutions were rainwater collection and moving their chicken coup.
 - a. Some negatives for the bigger bucket is that it is not fresh and the water will get hot in the summer. Rainwater is dependent on where you live and how much water you receive. Moving a chicken coop is also way too much work and expensive. The big bucket is helpful because it holds a lot and the rainwater is helpful because the water is fresh and you don't need to fill it up.
 - b. The bigger bucket would not meet our stakeholders requirements because they would still be having to fill it up and now carrying a bigger bucket. Moving the whole coup would not meet our requirements either because where the faucet is located is not a safe place for chickens.
2. Our stakeholder is currently solving this problem by walking up and down the hill to fill up the bucket.
 - a. The negatives of this is the amount of time needed and the positives is that they receive fresh water.
