(image is from source above)

Details:

The main detail about this design is that it was measured properly to accommodate the calculator's dimensions. Also, it can only hold a few calculators that may be scratched up in the surrounding area since they will be jammed up.

Analysis:

This design was successful at accommodating the designated customer but our community partner wouldn't want this design. First, the materials aren't recyclable which is a requirement for our community partner. Also, Mr. Scott wants at least 3 calculators to be able to be stored without any damages. To change this design in order to satisfy Mr. Scott, we would have to make the holder have more room, and the material would have to be recyclable.

Details:

- ***Convenient and economical***
- ***Solves the problem of transporting calculator sets***
- ***Holds up to 30 TI Graphing Calculators***
- ***0.88 lbs***

Analysis: This design provides a solution to the problem of transporting a high quantity of calculators. This also seems durable and easy to handle. However, this calculator holder doesn't seem eco-friendly, as it is made out of a fabric that doesn't seem easy to dispose of in a safe manner. Also, this holder runs the risk of calculators breaking if they hit each other inside of the carrying case. Because of this, this holder is unsuccessful at resolving our defined problem.

Image:

Details:

- Plastic screen with lock and key for security
- Interior filled with slots to store the calculators in.

Analysis:

There are not many flaws with this design attempt. It is secure, safe, and easy to notice when there are calculators missing. One flaw could be the key getting lost then the calculators could be stuck inside of the case. In regards to our community partner, this design wouldn't be suitable because it's too large. Mr. Scott wants a holder that could easily fit on his desk and can be easily accessible. This design would be more suitable for a storage of larger items.

Image:

Details:

- It was made to hold a plethora of calculators
- The design is easy to carry

Analysis: This design was successful because it was able to carry lots of calculators and is easy to carry however it is easy to lose track of the calculators and someone could probably take one home without you knowing. This design also wouldn't satisfy Mr. Scott since it is too large and it is inconvenient. Mr. Scott wants a simple place to store his calculator, not a box that can only be opened by a key. This takes away the convenience that he is looking for as well as the simplicity.
