

Element B

Element B: Documentation and Analysis of Prior Design Attempts

Prior Design Attempt 1 - Securing With Metal

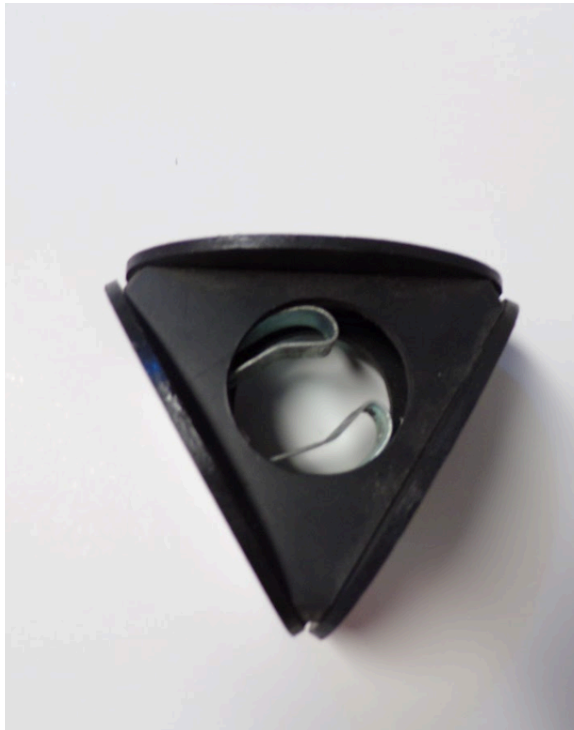

Figure 1. Securing Mic Flag With Metal Clip (Paul D.)

The biggest problem with this mic flag design was it scratched the microphone. It used metal to secure on the microphone, but when it was being taken off or put back on it would scratch the outside of the microphone. A strength this mic flag had was it secured well on the microphone as it would mold the holder to the metal grips creating a secure grip despite scratching the side of the holder.

Prior Design Attempt 2 - Logos On Stickers & Secured With Velcro (2022-2023 Engineering Design Class)

Figure 2. Mic Flag Logos Peeling and Fading (Paul D.)

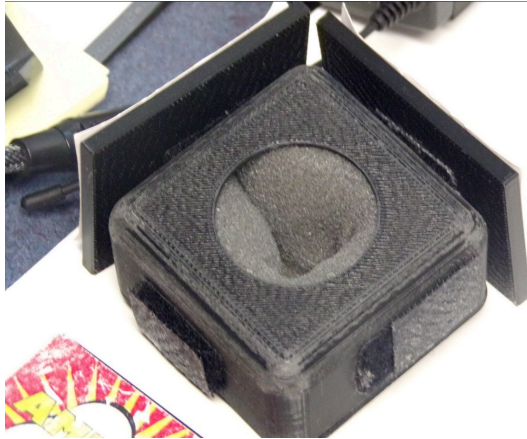

Figure 3. Adhesive on Panels Not Sticking (Jack S.)

Figure 4 & 5. Soft Foam To Secure Flag (Paul D.)

These mic flags were designed by last year's engineering design class. In less than a year of use, the stickers with the logos would start to fade and peel off. This is a major flaw in the design of a mic flag as it obstructs the logo of the company that the mic flag needs to promote. The idea of using stickers was a good idea as they are cheap and easy to replace, but was not successfully done as they faded and peeled. The advertisements on the outside are secured with an adhesive but it is common for the adhesive to become less sticky. The part of the design that failed was the sticky part to secure the advertisement on the mic flag. The failure is significant because having a secured advertisement is very important to representing the brand or advertisement. It was a good idea to have interchangeable logos as you do not need as many flags to advertise several companies. Sadly, since the adhesive failed, the interchangeability did not matter as the different panels would fall off. This design also used a thin foam to secure on the microphone, but as seen in figure 6, it falls off easily. The design was unsuccessful because due to the foam being very thin it was never able to really secure onto the microphone

Prior Design Attempt 3 - Rycote Mic Flag

Figure 6. Rycote Mic Flag ("Single Triangular White Mic Flag.")

Rycote's mic flags use rubber inserts instead of the foam found in most mic flags. These rubber inserts secure the holder by creating friction between the insert and the mic holder. This mic flag also has rounded sides which lead to a design that makes the center of the logos more prominent compared to a flag that is a regular triangle. By having a more prominent logo, the flag will do a better job advertising the company on the logo. This mic flag only allows for one logo on the sides which is not our goal in this project as we want to make most of our flags with interchangeable designs.

Prior Design Attempt 4 - Stiff Foam

Figure 7. Stiff Foam To Secure Flag (Jack S.)

This design uses foam to secure the mic flag on the microphone and a plastic box around the outside for advertisement. This design was a failure because after it was cut and used, the foam inside of the mic flag began to change its shape and it was unable to stay secured on the microphone. The foam is also visually unappealing as the foam was cut in a jagged fashion. The strength of this mic flag was that the part with the logos was sturdy and did not begin to fade.

Prior Design Attempt 5 - Soft Foam

Figure 8. Mic Flag On Bottom ("Sm7 Mic Flags: Studio Mic Flag: Custom Mic Flags: Impact PBS.")

This mic flag sits towards the bottom of the microphone, and is mostly used for podcasting. It would not work for our scenario. The mic flag we need will have to sit at the top of the microphone, so there is a handle the interviewer can hold on. For this one there is no handle.
