

Prior Design Attempt #1 - <Gregory Battery Shelf>

Mr. Gregory's shop

Mr. Gregory (Also an Engineering teacher at Marshall High School) developed a small desktop shelf to put battery chargers on. The shelf is by an outlet to keep the batteries charging. Excess batteries are kept in the tools while the others stay charging

This design is a tabletop shelf that can hold up to 3 chargers. Any excess batteries are stored in tools.

This is a decent small scale solution but does not offer if Mr. Gregory decides to upscale his battery and charger collection. The shelf itself is a bit unnecessary as it needs to take up space on a table instead of being out of the way on the wall or something.

Prior Design Attempt #2 - <Mr Lincicome table >

Mr Lincicome workshop

The design that Mr. Lincicome had for his battery storage can't really be called a storage system because of all the batteries that are scattered around the table and because of the different brands of batteries the few chargers that he had in hand would not work for others and this caused a problem of some batteries being completely dead or half dead and this would be determined for the STEM students in questions

The table the chargers were on was also crammed with other tools and there was barely any space

It has a poorly made design that make it nearly impossible to add or to remove old or new batteries and because it is in a very small corner of the work table every batteries that are located there are either not charged at all and this could leave Mr Lincicome in a disadvantage that can make his student fall behind in some of their important project get

Prior Design Attempt #3 - <Makita Battery holder>

Crivnhar

This is a small compact design that has already been tested and sold with a rating of 5 stars on amazon. It is well made and compact as well as expandable. Each piece of this rack is a module that can slide together with one other on each side.

Screw holes and a slide for the batteries to go into. Only problem is that the modules can't connect vertically as well.
