

Element B: Documentation and Analysis of Prior Design Attempts:

(previous air compressor projects)

A shaped piece of aluminum was shaved off part of its bottom part and holes were drilled into it. There is one big hole straight through the lower part and two on the bottom side so it can be screwed to the CNC machine. On one side of the center hole was where an air blower would be attached and on the other side was a swivel where an air hose would be attached when the aluminum block is attached to the side of the machine.
