

Element B: Documentation and Analysis of Prior Design Attempts

Prior Design Attempt #1 - <KidSmartz>

Image:

Details: KidSmartz is a child safety program to educate families about ways to prevent abduction and empowers kids in grades K-5 to practice safer behaviors. It is a .org site that is usable by anyone (most likely a parent) to educate kids. It also has ways to help kids that went through exploitations.

Analysis: It's a good education and tips but not something physical that can physically save a child. We have Micro-bits that a kid can hold and use, a website is important but can't physically save a kid.

Prior Design Attempt #2 - <Apple Air Tag>

Image:

Details: It is a tracker made by Apple made to track personal belongings. They can be put on keys, backpacks, bags, suitcases, wallets, cars, or pets. They are used and tracked from your phone. You also can play a sound from the AirTag to help find it.

Analysis: While it is a good accurate tracker, it still doesn't stop the kid from being kidnapped and doesn't let you know if a kid is being kidnapped. It's made for personal belongings like suitcases, not for people. With our micro bits we will keep track of people and be able to let others know if someone gets kidnapped.

Prior Design Attempt #3 - <Gps tracking bracelet>

Image:

Details: A normal tracker that you can get off. This device is Small, Lightweight, and Durable. Has real-time GPS Location Sharing with accuracy, range, and battery life.

Analysis: It has some good accomplishments and is good at GPS location sharing. But it might be a lil too easy to see and the cost is VERY high at \$130 dollars for one device. With our micro bits we can get the device to be way smaller so it is harder to see, and also way cheaper to about \$30-40.
