

1. The new problem is filling the MO staircase with a piece of artwork. Our new design is built specifically for this area and we are waiting to hear from Ms. Bussey with assembling technicalities. The staircase of MO has never had artwork.
2. We are now designing the piece for the staircase of FEW. After conversations with Ms. Bussey decided our design would fit better here. With the large window behind it, the mirrors will now be able to reflect light. The height of the installation will also avoid students touching them and breaking.

 - a. The issue we could run into is hanging the structure from the ceiling. In MO there are tile ceiling panels. This website shows ways to hang kinetic art from different ceiling types. For ceiling tiles, they use wire and different metal pieces to connect the art to the ceiling. The downside of this solution would be figuring out where to buy the metal wire pieces and how to assemble it.

b.

This problem and solution would be the same in FEW because it has similar ceilings.

2.
 - a. The new problem is a lack of art work in MO lobby. Our stakeholder has been seeking more installations and pieces to enliven the space. Our group's solution is to create a kinetic work that plays with the movement of light. The positive aspect of this installation is its ability to brighten the lobby both physically and mentally. Through the mirrored acrylic, any natural light it touches will be enhanced. And anyone passing through the space, including the staircase, will be able to interact with the art either by touching or observing.

b.

The lack of artwork is also a problem in FEW, therefore, our solution would not change.
