Element B: Documentation and Analysis of Prior Design Attempts

Prior Design Attempt #1 - Microphone Holder from 2022-2023 Engineering Design Class

Mr. O'Farrell, and from clips from Walpole Media on Youtube

1

Design by a previous year student (2023 HS Student)

3D printed, made so mic flags could be fashioned onto design, allows insertion of mic transmitter in the top of mic (does stick out of the top of the mic holder), allows for limited amount of movement without falling out.

This design attempt didn't necessarily fail, but it could definitely be improved on a lot as the top of the transmitter sticks out, and it can sometimes fall out of the mic holder if enough force is exerted on the transmitter.

Prior Design Attempt #2 - Microphone Holder from 2022-2023 Engineering Design Class

Mr. O'Farrell, and from clips from Walpole Media on Youtube

3D printed, made so mic flags could be fashioned onto design, allows insertion of mic transmitter in the top of mic (does stick out of the top of the mic holder), allows for limited amount of movement without falling out.

This design attempt didn't necessarily fail, but it could definitely be improved on a lot as the top of the transmitter sticks out, and it can sometimes fall out of the mic holder if enough force is exerted on the transmitter. This design is even smaller than the previous mic holder, making it more difficult to hold.

Prior Design Attempt #3 - Saramonic SR-MH1

Saramonic

1: SR-MH1 Universal handheld holder for 2.4GHz clip-on microphone transmitters w/ windscreen

This microphone holder was developed by Saramonic, a large company who specializes in sound quality products. This design holds several different kinds of microphone transmitters, and resembles a real microphone.

This product does not meet our first design requirement, as it is not compatible with the SM58 microphone transmitter we are using.

Prior Design Attempt #4 - Saramonic Blink500 Pro HM

Saramonic

Name: _____

Date: _____

Class: _____

Turns a blink 500 Pro TX clip-on transmitter into a versatile handheld microphone

This microphone holder was developed by Saramonic, a large company who specializes in sound quality products. It allows for a microphone holder to be clipped on, allowing for it to be held on a stick, like a real microphone. It also allows for the use of mic flags.

The microphone needs to be powered by batteries or a charger, however, so it is not completely independent from the transmitter. It is also very small in size.
