

When designing our product, we had to figure out what our biggest priorities were. The highest one was that the design needed to be durable/not be prone to mold and rust. This is because if it is not durable enough to withstand the constant water flow, then it is not really any improvement to current shower heads. The next most important thing was that the design should have been cost effective. It needs to be cheap enough so that the final price is cheap as well. Our next thing was the design needed to be all purpose. It needs to be able to fit in any size shower. This was a big one, the design needed to be easy to package. If there are too many bits and pieces to pack then nobody will be able to figure out what goes where. Every priority up until this point was considered “high priority”. Some “lower” things on our list were that the design needed to be fixed to the shower. It can be one of the ones that can be moved around. The worst was that the design had to be aesthetically pleasing, as nobody wants an ugly shower head. The color for our shower head doesn't matter, only how well it works. These were all just our “top” priorities when designing the final product. We considered these while drawing mockups and when speaking to Mr. Roberson.
