

1. Our design requirement is to come up with ways to improve the chariot. Because the chariot is welded together, there is not that much we can do to change the tire design, and also because Garrison has been winning the chariot race in the past years, it is not necessary to completely change the design. One thing we can do to improve the chariot is adding new tires that are more treaded and larger. We also want to add grips to the handlebars to make it easier and more comfortable for the students to pull the chariot.
2. Our priority design requirements are to redo the tires, add better grips to the handle bars, and add lights to the wheels for extra decoration. We are adding tires with a bigger diameter and around the same thickness. The handle bars need better grip so its not as challenging to pull the chariot.
3. Our priority list: 1. Better traction 2. Faster overall (speed) 3. Lighter in weight
4. Our top priority design requirement is getting new tires, since the current tires are worn out and smooth, and the lack of tread is not good for when the chariot runs on the turf because Garrison's turf is wood chips. Grips is the second priority since it relates the functionality of the chariot itself. Adding lights is one of our priorities because we want to make the chariot more spirited because Bryn Mawrs chariot is yellow and green, even on the tires. We plan to add blue bike lights that will light up when the tires spin to represent the Garrison spirit.
5. These design requirements will meet our stakeholders needs because they will help the chariot physically move better and faster and the improvements to the design will also allow the Garrison 8th graders to have an easier time pulling the chariot.
- 6.
7. Some of our design requirements include adding new tires that are more treaded and larger to improve the speed of the chariot. We also want to add grips to the handlebars to make it easier and more comfortable for the students to pull the chariot.
8. New tires - bike tires in order to improve the speed
