

- To create an easier way to water the chickens
- To create a solution that allows chickens to have water for a longer period of time without human input
- To stay in our budget
- Environmentally friendly

Material documentation

- First mesh material ordered: Holes are too small, material is like a screen rather than mesh. No water can get through so this will not work. Also not enough mesh to cover the barrel opening which we don't have yet. Will need to return.
1. It collects rain water properly and will be more accessible to give chickens water without the interaction of humans for at least a couple days. We have a budget to follow and preferably needs to not intervene with the environment or produce any waste. Our stakeholder needs the chickens to be okay with no human water filling particularly during the summer when no one is at GFS. That is her main requirement.
 2. Budget \$200 which is funded by ASU (high), time period of self filled water source (high, the purpose of the project), easier way to get water for chickens (with this invention it will be easier), environmentally friendly (lower)
 3. We need to keep track of our spending if it is not already watched by Mr. Bean (if we don't have the funds or go over we cannot produce a solution).
 4. We can easily measure water collection over x amount of time compared to water capacity as of right now with the gallon bucket filled by students or staff. Feedback from chicken caretakers will be important if it has become easier to give water to chickens. \
 5. These requirements have formulated our design plan that has so far stayed in budget and seems to be easier to tend to chickens. No human interactions should be needed unless there is any sort of clog with rainwater/gutter collection.
 6. Our primary stakeholder agrees with our plan and gave us the feedback of adding spickets to inside of the coop for the chickens to directly drink out of instead of using rainwater collection in a bucket that would get dirty. We have needed to make changes and this fluctuates our budget and overall plan. There are a lot of things to figure out with the additive of PVC pipe with the spickets.
