

Element D: Design and how to build the filter.

Step 1: Get two empty containers that can hold one gallon of liquid and cut the bottom off of one and the top off of the other.

Step 2: In the container with the bottom cut off, (in this order) cut a piece of cloth and put it over where the lid would go on the container, put a rubber band around the top of the lid over the cloth to hold the cloth on, cotton, sand, charcoal, gravel/stones.

Step 3: place the container with the materials (top facing down) on top of the container with the top cut off.

Step 4: Slowly pour dirty water onto the gravels in the filter to allow it to go through the filter and come out as clear water.

Step 5: With the clear water collected in the bottom container put one drop of bleach per quart or liter to clean out chemicals and purify the water.
