

Mr. Blanchard's Element D design.

The process for generating this design was first we decided to brainstorm all of the ideas in our notebooks and sketch them out. Then we chose a final prototype and decided on what prototype to use. Then we made the Prototype and tested it out in Mr Blanchard's classroom. That was the process for generating the design idea. The way that we chose the best design was By looking at all of the prototypes and then choosing which one would be the most ideal for what we are trying to achieve. We looked at multiple requirements and chose the one that fulfilled the most requirements. That is how we chose the final design. Our plan of action was to get the materials that we need measure them all at all and design the best prototype that we could in order to make sure this project was successful. Some of the attributes of this design include a 3M sticky pad with high quality to make sure it stays on the wall. non-stainless metal hooks that make sure they stay in good shape over time. a strong elastic bungee cord measured and cut specifically for the needs of the blinds. And high quality velcro to ensure that the blinds stay shut. The cost of The materials vary from price to price, for the metal hooks it was \$10 for a four pack, for the 3M sticky pads it was \$12 for a six pack. for our bungee material it was \$7 for 20 ft of bungee, for the velcro it was \$2 for five pieces.
