

Element D

Prototype Designs

Solutions the design team came up with:

- Filter boxes
- Seal tight storage boxes (humidity resistant)
- Insulating the cabinets that are already in the class
- Dehumidifier

The final decision and explanation:

Insulated storage boxes with racks inside of them. The engineers looked at all of the mini groups projects, and included various functions that were previously discussed to create a final design. The engineers found flaws in the design, and decided to fix it. The current prototype solution was based off of a criteria list, so the engineers discussed and decided that a storage box would be most useful in meeting all the criteria.

Executing Solution:

To make the solution come to life, they split into two groups, working on the design, and how the design will be tested. The people in the design group are working on which dimensions will be best for the prototype before scaling up. The design is simple to replicate, although to ensure efficiency, the engineers plan on providing a list of materials, procedures, various stores to buy materials, dimensions for storage box, and the amount of materials required for each component.
