

- A way we are attempting to generate a solution of making GFS's chariot better than Bryn Mawrs is to first figure out why Bryn Mawrs chariot is considered to have a better design. We emailed Mr.Smith and asked if he took any pictures at Latin Day last year that we could use to spy on their chariot design.
- We are going with changing the wheels because its all we have the skills to do but if we could do more we would change the angle of the handlebar and the basket shape
- We went to the tire store to pick out a tire to fit the chariot. We ran into a few issues that we did not expect. We wanted to get a new wheel and tire but we were informed that if we wanted a new wheel we would have to get it custom-made because the axle isn't standard size. We found a bigger tire and taller but when it was blown up it would not have enough clearance between the metal and the tire. We found three tires that may work and he decided to order the one that would best work for us. He said that he would be able to mount the tire and blow it up for us.

These were the three tires that we considered. We ordered the first.

- Mr Beam found different wheels that may work better than the tire shop wheel. We are going to order a wheel from amazon along with a spacer for the hub in the axel because our axel is too large for the axel on the new wheel.
 - [Link for tires \(we need two 26x1.95 3/4 hub\)](#)
 - [4 spacers \(one 2 inch and one 7/16\)](#)
