

- Using ideas from the internet of already invented solutions to our similar problem
 - From our understanding, most chicken coops are closer to water sources than ours.
 - This makes us think that the placement of our chicken coop and the water source was not a priority
 - Moving the chicken coop would be too much of a hassle
1. First we brainstormed ideas with the help of the internet. We tried to think of the most efficient way that would cost the least amount. We wanted to make sure in brainstorming ideas that it would satisfy the stakeholder but most importantly the chickens. We also searched up how much water chickens need and if they can drink rain water.
 2. We chose our rainwater collection idea because we did not want to integrate a new water source that used energy from the school. This idea would be energy efficient that does not require human work to fill water. We might have to be concerned about it freezing but the main use of the rainwater would be during the summer when not always someone is at school to tend to them.
 3. First we talked through ideas, made some sketches, and used inspiration from the web to help us brainstorm ideas. We have researched and made our list of supplies from our plan. We have sent supplies to our funder who buys it and we are sent the material. As of now we need to figure out who will help us build as well as measurements and final supplies. We need to figure out kinks in our design.
