

Our solution to the lack of art in MO lobby is to create a hanging piece that has a reflective mirror on it. Our process has been talking to all the stakeholders including Ms. Bussy and Ms Sleters. We have gone through many design places such as the art building lobby, FEW staircase, and MO lobby. Our final decision is to make it for the lobby of MO.

The piece will be customized for the staircase and will be hung from the ceiling. Our inspiration is from other pieces of kinetic art that have been displayed in museums. Our original sketch had the mirrors stemming from a cone however our new sketch will come from a rectangle. The final solution is customized specifically for the MO staircase and will extend only to the railings. This was chosen because it is a high traffic area and is the first thing you see when you walk in the building.

Right now looking at the space it is very boring and people's eyes are drawn to the yellow floors and gross walls. The addition of this piece is to draw viewers' eyes upward to the large window. This window is overlooked right now and by reflecting the light that is coming inwards it can make the staircase a more inviting space.

We are now designing the piece for the staircase of FEW. After conversations with Ms. Bussey decided our design would fit better here. With the large window behind it, the mirrors will now be able to reflect light. The height of the installation will also avoid students touching them and breaking.

We have also changed the design to be a square with the mirrors hanging from each side. The strings will be very close together and have the same amount of mirrors on each. Each mirror will be laser cut to be one square inch. All of the strings will be equal length unlike the first design. This is more realistic than our first design of customizing the length of each string depending on the height of the railing. The mirrors will have two holes in each that will be tied to the string. We choose to use monofilament as the string. This is strong enough to hold the weight of our mirrors, but also clear to match the aesthetics of our piece.
