

Element E: Application of STEM Principles and Practices

- We used CAD to design and 3D print the adapter and we used CAD to design the model as well, this contributes to the ideas of technology and math. We assembled the model with lots of PVC and used lots of tools like a bandsaw, sandpaper, hacksaws, etc. This represents the principles of engineering and technology as well.

CAD work

- We had two different proposed solutions to fix the issue of the prototype fitting to multiple wheelchairs. One involved cutting the outer edge of the PVC pipe. To make a sliding mechanism. The other idea involved 3D printing a piece to that would still grip a smaller piece of PVC keeping it in place, but allowing it to slide back and forth, shorting and furthering the length of the prototype.
- Our project has been reviewed by Dr. Gang, what qualifies him is he's a professor at mason. Well some things Dr Gang commented on was that we could fix one of the adjustable parts. He also said that our project was very good overall.
