

Element E:

Applications of STEM Principles and Practices

STEM COMPONENTS

STEM elements played a part in our solution; different eliminates were utilized to help us create a prototype. Math was used to create the curve of the mirrors in desmos. Geometrical elements are going to be used to calculate the surface area of a prototype. Engineering plays a part in our solution because it used to design the various features of the mirror. We used engineering to come up with the materials needed to construct the mirror and the measurements for its different parts.

How might they impact your designing, building, and or testing phases?

STEM components will impact our designing because they will help to craft and bring the design to life.

Things like geometry (math) will impact how we map out the shape of the prototypes and the final design.

Engineering will help us test

We chose to create a mirror because of the multiple angles of vision it would provide to the librarian, Mrs. Tatro. We will test the mirror materials by applying a small amount of the adhesive to the cardboard and seeing how it turns out. This will be tested by the amount of visibility the adhesive provides.

The librarian, Mrs. Tatro, told us that her visibility behind the bookshelves was very limited, which reinforced our decision to build her a mirror.
