

PART E. Application of STEM Principles and Practices

Creating murals requires heavy research into many scientific fields, including psychology and nutrition. Color theory was reviewed numerous times as we reflected on how colors on the murals would affect students' moods and development, as well as how they would aesthetically correlate with the school. We used technology to design our murals, sketching them out on digital apps on an iPad. Design was a major part of this project, reflecting many concepts that engineers use on a daily basis. Once we are able to paint the murals, we will have to use math to measure the wall it will go on and use a projector to assist us in sketching it.
