

Element E

My solution is supported by multiple different projects I've researched beforehand. It will reach design requirements by being simple and inexpensive while being easily made. This research helps me also narrow down what could possibly work.

My solution was reviewed and failed by layering things wrongly. The way it should've been layered was using rocks for the top most layer you can catch bigger things like sticks or leaves, then charcoal as the next for filtering out contaminants, sand for smaller, more hard to filter things, and cotton or cheesecloth to get anything left behind. It would be decently efficient at filtering everything out.
