

Element F: Consideration of Design Viability

OBSTACLES AND DIFFICULTIES

There is a possibility that it will be difficult to figure out the placement and positioning when installing the mirrors in the library. A potential obstacle the class might face with the mirrors is stabilizing them. To address this problem, we will be using durable and sturdy materials and making prototypes. The prototypes will help the design group figure out the visibility and reflectiveness that the mirrors display. We need to figure out if the image that the librarian's going to see is going to be more clear or blurry.

Regarding materials, it might become difficult to find something that can both reflect in the way we want it to, and fit over the shell of the mirror correctly.

We plan on addressing these issues by testing multiple products what could provide the reflective surface instead of just one.

We know that our end users will be satisfied with the final design because of the amount of testing we will be doing on the product. With thorough testing and experimentation, our team will be able to find the perfect angles, style, and positioning for the placement of the design in the library.
