

ELEMENT F

Parts of our project:

Handle: The handle may not meet our design requirements if it is not attached to the body of the design properly. If it isn't the correct height then the proportion between the body and the handle would also end up causing an issue as well. How we'll avoid this: To avoid this we're going to try to find a handle that was already pre-made; this would ensure that the handle doesn't have any balance issues. We will also make sure to measure the length of the handle we want to use so that we know it is easy to move around.

Body of design: The body of the design may not meet our design requirements if the wood is not of good quality. If the wood is weak and irregular in size then it would cause some issues for our project. How we'll avoid this: To avoid this problem we will measure our pieces of wood before using them for our project. We will also purchase durable pieces of wood that we know will last for a while.

Button: The button of the design may not meet our design requirements if it is not able to move properly. If the button doesn't move properly the balls will not be able to dispense. Examples of the button malfunctioning would be it getting caught while sliding out of the way to allow the ball to come out. How we'll avoid this: We will avoid this problem by constructing our button properly to ensure that it doesn't get caught anywhere in our design.

Dispensing Mechanism: The dispensing mechanism may not meet our design requirements if it does not shift in the proper direction to allow the balls to come out of the dispenser. How we'll avoid this: We will avoid this problem by constructing our dispensing mechanism with precision and concentration to ensure that it doesn't fail when it dispenses.

Wheels: The wheel of this design may not meet our design requirements if the wheels are too small to handle the weight and capacity of our design. How we'll avoid this: We will avoid this problem by picking wheels that can sustain the weight of our project.
