

Element E

For Element E we used a lot of different elements Of stem. We used math multiple times in our design. The first time that we used math was when we had to measure out the different sizes of the windows and the blinds. When we were writing out our prototypes, that's when we also used math, we used the math to measure out the area and then wrote it all down. After that we also had to use math to calculate and figure out how big we needed our materials to be to be able to successfully hold the design and do what it is supposed to do. That is how we used math in our design. We also used Science in our design a few different times. The first time that we used science was when we had to think about all of the different environmental impacts that are causing the blinds to make noise in the first place. So what we did is we talked to the stakeholders and figured out that the wind is what makes problems happen. Then we took the problem into consideration and he figured out how we could fix it. That is how we used stem math and science in our design.

Element F

Making sure that we met all of the requirements was not an easy task. The first thing that we had to do was figure out all of the requirements so what we did was talk to the stakeholders and ask them the problem. The next thing that we did was figure out how we could solve all of the problems and research the materials to do that. then after that we looked Many different solutions that could meet the requirements that were listed out. Since there were many different times we had to find many solutions and we had multiple solutions that only met a few requirements. So what we did is we put multiple Solutions together into one idea and we were able to meet all of the requirements. That is how we met all the requirements.

Element G
