

- Within our meetings, minimal solutions were discussed. We decided that we definitely wanted to replace the wheels in order to make the chariot faster and move as smoothly as possible on turf.
 - Both stakeholders agreed that treaded tires would be beneficial, though we are also working to keep the chariot as lightweight as possible.
 - We are discussing ways to adjust the handlebars and make it more accessible, though we are struggling due to the desire to keep the chariot light.
 - In order to be successful in our adjustments we have measured and ridden on the chariot to see how it moves and what the measurements are
- None of this is able to be completed at school because none of us can weld and we will be left with no chariot if we even try
- During our meeting with Seggy, we didn't gain a lot of knowledge and didn't know how to proceed from there. When we met with Mr. Beretta, he wasn't extremely informed about the structure of the chariot and therefore could not provide much help to us.
 - Out of nowhere, while assisting us in removing the tires from the chariot, the maintenance guys ended up being our most beneficial stakeholders. They informed us that having taller, more treaded tires would be the best option and that getting a bigger axle would help too.
 - It was interesting for us to see that throughout our two meetings, this one quick encounter with the maintenance guys was our most informative conversation. We took this new knowledge with us as we went to shop for tires.
