

We scheduled a meeting with Ms. Shao to discuss her needs and preferences. After we got the general idea we proceeded to create a prototype visualizing our solution. After the prototype was completed we scheduled another meeting with Ms. Shao to discuss the potential changes and improvements. She was positively surprised with our creativity and added some suggestions that we implemented later into our project. It is important to stay open-minded and flexible while discussing projects with your stakeholders.

Our solution is based on rainwater. It is going to include a barrel - for water storage, mesh - for filtration, and a pipe with drain holes - for the chickens to be able to use. Everything is going to be sealed with silicone, preventing the water from spilling.

We gathered all of our materials and after sketches, our design became simple to make. We have to measure everything out correctly, cut the pipes, and adjust the elements to create our final product.

Ms. Shao (head of the chicken club) and Mr. Beam (engineering teacher) were extremely helpful, giving us advice on materials, solutions as well as improvements that concluded in the final product. They were always supporting us, giving us live feedback and suggestions when needed.
