Element F: Consideration of Design Viability

In the boys dorms the dorm residents need a place to put their toiletries because there is not a built-in shelf in the communal showers and setting things on the floor is unsanitary. Solving the problem can help the dorm students place their toiletries somewhere without having to set it down on the ground. The problem is that there is nowhere to hang your shampoo and that leads to people putting it on the ground.

It will hold an adequate amount of toiletries and will stay in place if cost efficient Is elevated to an appropriate height. Our proposed solution will work because it will be cost efficient and elevated at the proper height. It will also stay in place so that if someone bumps into the caddy, it will not fall or break off. The solution will be realistic because we are going to 3D print the design. By using the 3D printer we have more access to parts that will not be hard to make. We can also use tinker cad to make a design come true.

Our design is measurable so that if someone needs to find a place to hang it on the wall they can easily measure the shower caddy. We also added holes on the sides and bottom so that our caddy would be able to drain the water that got inside after a shower. It is a built-in caddy that will attach to the wall in the shower. It will be 6 inches in width, 12 inches of length and 6 inches tall. It will be a permanent solution though if needed is easy to remove

The experts said that the idea is good and we can always think about adding onto the thing in the future. The expert is qualified because he was an aeronautical engineer for his job. He also knows a lot about engineering so he gave us good tips which helped with our prototype.
