

This is the chart we used from determining what would be viable or not for our final prototype:

Design Viability Description	Connection to Design Requirement	Credible Evidence?
<i>Example:</i> The solution is inexpensive	<i>Example:</i> Design does not cost more than \$X	<i>Example:</i> Create a table of costs for each component of the solution.
The solution is efficient	Design will not take more than 20 minutes to install.	Normal installment for a shower head takes no longer than 20 minutes so our design will either be at that or take less time.
The solution is durable	Design will not mold or rust easily.	Normally, experts suggest changing a showerhead about once a year. Obviously not every shower head has such a short life and ours will be very durable.
The solution is easy to install	Design will not have many steps.	Normally to install a new shower head you have to take off the new one, screw the mount onto the shower (water source), attach the hose, and check for leaks. Ours will be similar to this but as easy as we can make it.
The solution will be as light as possible	Design, despite having an extra funnel, will still be a reasonable weight.	Normal shower heads weigh around 1-2 pounds and ours will be around this same weight.
