Element F: Consideration of Design Viability

Template Instructions This template is designed for technical writing and succinctness. Replace placeholders with precise details from your project, and ensure your responses are backed by credible evidence to fully meet the rubric's criteria.

F1. Design Viability Judgment

- **Design Overview:** We want to connect the blast gate to a lever using a bike wire so that the student can use a lever to open the blast gate
- **Viability Evaluation:** Our design is very viable since all you need is to cut out some wood and connect them to bike wires.
 - **Evidence:** The prototype that we made was somewhat similar to our design and focused on the same goal: to open the blast gate.

Risk Assessment

- **Identified Risks:** The risks that we may encounter is not finishing it on time, there being too much friction to open the blast gate, and the bike wire fraying after a couple of uses.
- **Mitigation Strategies:** Some strategies that I could use to mitigate these risks are buy better quality bike wire, sand down the wood, and work faster and more efficiently.

Expert Feedback

- **Consultations:** Our expert said that our prototype was very viable and he would like to use that sort of design for his room.
- **Feedback Implementation:** Some adjustments that were made because of expert feedback were trying to make the bike wire move more smoothly and stop them from fraying.
