

Element G: Construction of a Testable Prototype

After searching through the internet and looking at different types of filter that people have made before I started to get an idea of what I wanted to make it like. Once I decided what I wanted it to look like I had to decide what materials I wanted and where I wanted them to be placed in the filter. First I made a sketch of what the filter would look like before building it so I could decide what would be best before building it. Once I had the sketch I got the materials and had to decide on the amount of each material I needed to put into each layer of the filter. I cut the bottom off of a gallon sized bottle and then put all of the materials in it then I cut the top off of another bottle that the filter would be on top of. Once this was completed I was finally able to test it and see how well it would work.

This is what the filter looked like after it was built for the very first time.

This is the sketch that I drew before building the prototype to get an idea of how it would look.
