Element G: Construction of a Testable Prototype

In the boys dorms the dorm residents need a place to put their toiletries because there is not a built-in shelf in the communal showers and setting things on the floor is unsanitary. Solving the problem can help the dorm students place their toiletries somewhere without having to set it down on the ground. The problem is that there is nowhere to hang your shampoo and that leads to people putting it on the ground.

We cut out three cardboard pieces that are 12x6 inches and two that were 6x6 inches. Then we taped them together at the corners. After that we taped around the entire box and poked holes in it to drain water. Mr. K then told us to add a hook so we made a hook out of cardboard and wrapped it in tape and taped it to our caddy.

Mr. K told us that we need to add a hook on the side and other than that we had a good design according to him. Mr. K is qualified because he is a part of the duty team in the dorms and he is part of E4USA.

Parts of it cannot be tested because of the materials we used (cardboard and tape). These materials did not let us test how it would do with water or how durable it is. The hook was also very weak being made of cardboard and could not hold anything. We could test how many bottles it could hold.

We built the final prototype with a 3D printer but we made it too small.
