

Element H: Prototype Testing and Data Collection Plan

How will you know your solution worked?

If our solution produces a higher voltage than previous iterations, we know that we were able to improve upon our design. Because our designs are small scale, they will not be able to completely charge a phone battery at a fast rate. However, they still provide electricity and power that would be useful when scaled up and used in the real scenario.

What is your plan to test your prototype?

In order to ensure that our prototype is tested correctly, the Blades group will come together and collaborate with the connections group to set up an efficient testing method to create a functional wind turbine. After the wind turbine is connected, it will be tested using wind/air from a fan to see how much wind power each separate design can produce.

What are the optimal results?

The most optimal results will be all wind turbines yielding a higher amount of wind energy than the initial class trials.
