

	Trial 1	Trial 2	Average
Old Tires	26 seconds	24 seconds	25 seconds
Tire shop tires	20 seconds	22 seconds	21 seconds
Amazon tires	n/a	n/a	n/a

Our procedures:

- was have consistent pullers and weight on the back
- Start the time form when the pullers start to when they cross the line

Designer requirements

- We accomplished it being faster because of our time
- With bigger tread size made the traction better resulting in better results
 - Tread on original tires were little to non
 - Current tires have one quarter inch tread
- It was testable by seeing the tread difference (talked about it with beam) and was noticeable in our time difference.
- The pullers said that it felt lighter and easy to pull with the new tires on

We have run our experiments by Mr.Beam, the feedback we got from him was having controlled variables, having plans, and we have talked with him about the larger wheels but ultimately ruled them out. He is qualified because he has a degree in applied mathematics.
