

We tested that water was able to flow through the pvc pipe and be able to go through nipples with a water bottle. It worked.

We then tested if water flows through the pipe and into the barrel. It also worked.

On one of our final days constructing the rainwater system, we saw a chicken peck at a nipple on the pvc pipe and water came out. This proves that the chickens will know how to use it and they already are starting to feel comfortable using their new water supply.
