

Element H: Testing

High and low priority requirements (Element C):

- **Aesthetically pleasing** - The visuals of the project must be pleasing to the eye, if not the project would be taken down. This will be decided by our stakeholders, Mr. Gleason and his students. To more accurately mimic a real window, the scenery of the window must display nature. This is also recommended by our stakeholder, Mr. Gleason.
- **Magnetic (Detachable)** - For the convenience of Mr. Gleason, the window must be magnetic. Drilling holes into the wall is unacceptable.
- **Lightweight** - To prevent the window from falling and putting less stress on the magnets. The goal is to have the window equal to or less than five pounds.
- **Size** - To fit into the given space and to listen to the preferences of Mr. Gleason the window must be no bigger than 2ft by 2ft.

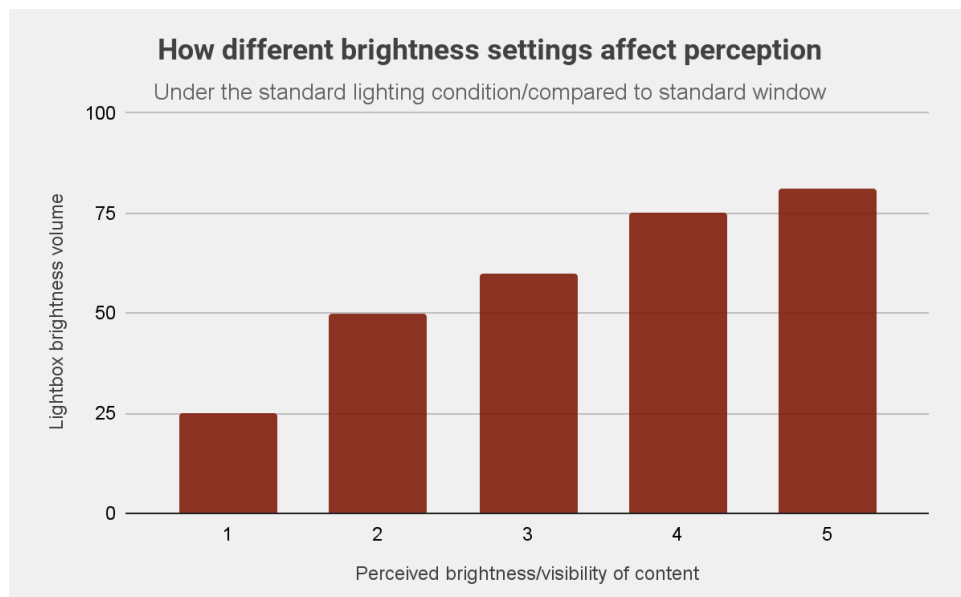

We will test the viability of our design with regard to aesthetics and light by measuring the perceived brightness or visibility of objects with the goal of achieving clear visibility as the minimum for success.

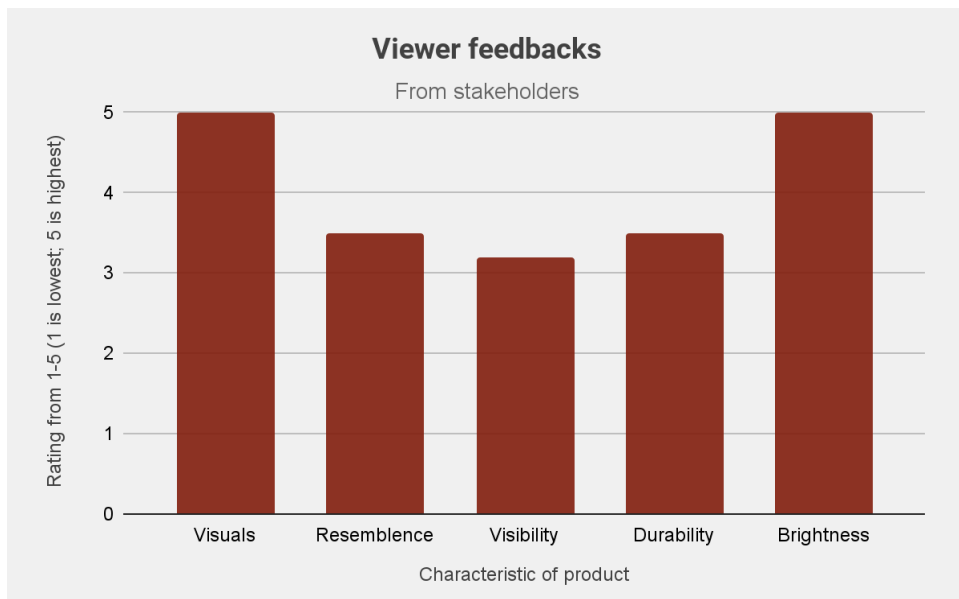

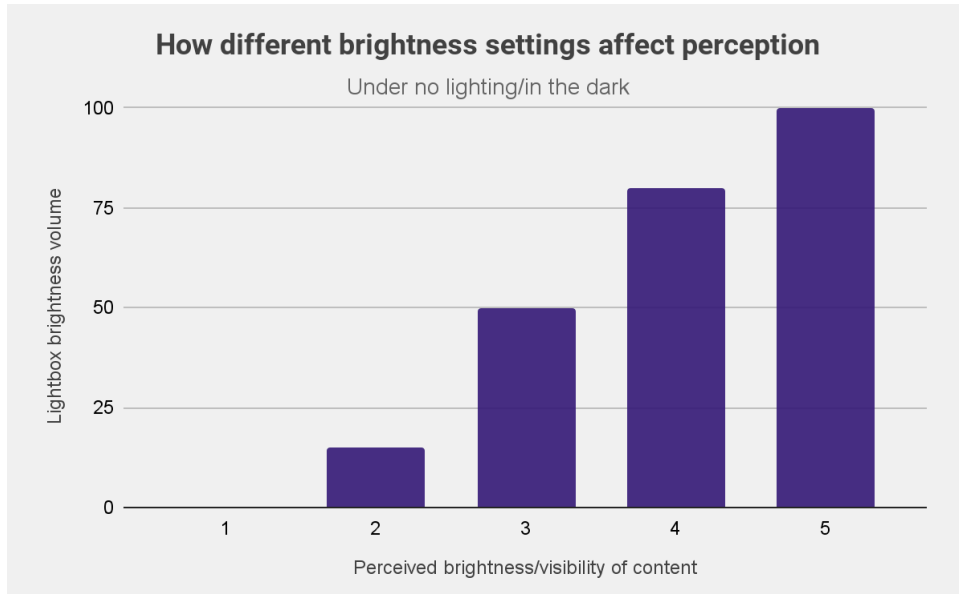

Experimental Control: Standard lighting condition or a regular window

Independent Variable: The brightness or intensity of the lightbox

Dependent Variable: The perceived brightness or amount of light transmitting through the paper

Testing in different conditions:

Brainstorming:

1. Visual inspection - Is it realistic and aesthetically appealing? Does it fit the overall vibes of the room? Does it blend in or stand out too much?
 2. Light test - How well is the natural light distributed? Does it mimic sunlight?
 3. Durability - Is the material durable? Will it withstand different conditions and last long?
 4. Safety check - Are there sharp edges or hazards that can cause injury to the stakeholders? Chance of it falling?
 5. Create a poll (e.g. Google Form) to receive personal ratings from stakeholders
-
