

Element C

Criteria (listed from highest to lowest priority)

-Must be usable at least 4 times (high priority)

This is important to the zookeepers as they want more than a one time solution and this would enrich the lives of the dragons more since they hunt every few weeks.

-All non edible materials must hang above 4ft off ground of habitat at all times (high priority)

This is important because the dragons can jump up and anything less than four feet high they can reach with their jaws. This means they could chew on these non edible materials and damage their mouth or worse swallow the parts.

-Must withstand pull force of 1,150 N (high priority)

This is to ensure the dragons do not pull the entire design down and chew on the non edible materials.

-Must entice dragons to run across habitat 2 times (high priority)

The zookeepers emphasized that they want the dragons to run across the length of the habitat 2 - 4 times. This also helps the health of the dragons as it emulates the hunt.

-Must be controllable by zookeepers from outside the exhibit (medium priority)

The device should be controllable by the zookeepers from outside the habitat as it promotes the safety of the zookeepers. *Originally marked as a high priority, this criterion was later changed to medium as the zookeeper clarified they are able to enter the exhibit with a protective shield. So ideally they wouldn't have to enter but it is not the end of the world if they do.

-Must not corrode when exposed to rain (high priority)

The habitat is outside and exposed to all sorts of weather. The zookeepers do not want any corrosion to increase reliability which will prevent any device failures that may harm the dragons. *It is true but if needed an alternate solution could be to make it removable, so they could store part or all of it inside.

-Must be easily sanitized (low priority)

The zookeepers do not want any mold or bacteria to grow on the device so they want it to be easily sanitized. This protects the health of the dragons as they will not be exposed to this mold and bacteria.

- * means it was an edit made by the zookeeper after we submitted the original criteria to them

Constraints

-Must be manufactured and delivered by May 11th.

The zoo keepers want the product delivered by May 11th as requested,

-Budget of \$250

This is important as we only have \$250 to fulfill the requests of the zookeepers.

-Can not use live prey

The zoo keepers have stated that they do not want live prey used to their ethics.

-Must be covered in natural materials if permanent

The zookeepers want the habitat to remain similar to the dragons' natural habitat so anything permanent must look natural.

Stakeholder Validation of Criteria

Everything else looks great!
Thanks for all your work on this project!!
