

Element C

Design Requirements

1. Playability (highest priority)
 - a. Priority reason: Our project is to create a game design, so our main goal is to make sure that our design allows the game to be playable enough so people can enjoy the game. ‘
2. Sturdiness
3. Aesthetic
4. Size (lowest priority)
 - a. Priority reason: The game should not be too small or big, but the size of the actual design can differentiate.

Primary Stakeholder Validation

- Playability
 - Our stakeholders should be able to play this game and have fun. The design should not make the game too difficult to play because of its constraints. This is the most important requirement because it is the center of the whole project.
- Sturdiness

- Mistakes can happen, and someone can accidentally drop the game or its pieces, and if it is not able to handle force and breaks too easily the game won't last long and possibly not meet our goal for this game.
- Aesthetic
 - The game must look somewhat aesthetically attractive so more students will be willing to check the game out and play it.
- Size
 - The media center has limited space. If the design is too large it can take up too much space and make it difficult for other accommodations. The design can also be too small. This can make it difficult for people to see the game and makes it easier to lose it.

Our stakeholders agree with our requirements and based on our current design believe we need to work more on the aesthetic of the game. As of 6/2 our design has some rough edges and a

tan color. We will work on this to make it better and more appealing.
