MyDesign Portfolio

Element C Initial Template

Element C: Presentation and Justification of Solution Design Requirements

Design Requirement #1 (HIGH Priority) Safety (no sharp edges)

The reason we need to have no sharp edges is to ensure that the rabbits don't get hurt and are safe at all times from cuts, scrapes, and to ensure they can't chew on anything sharp that can cause problems internally.

This ties into my research because without knowing that rabbits chew all the time and need a safe environment to chew and play we wouldn't know we need to ensure there are no sharp edges.

Design Requirement #2 (HIGH Priority) Material (no chemicals , withstand cleaning chemicals)

We need a material that is clean and non-toxic for the rabbits because there are a lot of materials that are harmful to rabbits, therefore we need to choose our materials wisely.

This ties to my prior research because without knowing what non-toxic materials to use, you cant build a safe space for the rabbits

Design Requirement #3 (HIGH Priority) Space (entertainment , size)

The rabbit needs a space to roam around and have entertainment to not get bored of. So it needs a big space to feel comfortable.

It ties to my research that rabbits need tunnels for them to roam around in the space to play in or simply just entertainment.

Design Requirement #4 (HIGH Priority) Transportable (collapsible)

The reason for the design to be transportable/collapsible so it is easy to move around to change up the rabbits enclosure.

In the paper of the problem we were required to make the design transportable for the workers to move the design around and rabbits like things to be changed up sometimes so they don't get bored.

Design Requirement #5 (HIGH Priority) Access to rabbits (always having eyes on them)

Access to rabbits are important because you need to be able to reach the rabbit if in need, or really just in general

We know that in the research that the workers want a way to get to them easily and to get access to them if anything goes wrong.

Design Requirement #6 (LOW Priority) Isolation

Isolation between the rabbits is important because rabbits sometimes need space and if they need to get away one of them can leave the other. This also allows the rabbits to stay compatible and not get aggressive to one another. If they are together for too long.

This ties back to my research that if rabbits are with each other they can get aggressive over being with each other for too long with no alone time.

Design Requirement #7 (LOW Priority) weight (no component heavier than 15 lbs)

The reason we put weight so low is because you don't want something that is so heavy you can retrieve it out of the cage or can't easily move it. We also can tweak the design and build if each component may go over 15 lbs.

This ties into our research that we need to ensure that it's not overly heavy and not an arm sore to move.
