

Element C: Presentation and Justification of Solution Design Requirements

Design Requirement #1 (HIGH Priority)

The first highest priority is to make sure it's safe and habitable for the rabbits once they move in.

This ties with our research because we've learned that rabbits need to feel safe in their home or it will cause them stress and scared.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #2 (HIGH Priority)

The second highest priority is to make sure we use no toxic or harmful materials towards the rabbits

This ties with our research because we've learned that some materials like metal, aromatic wood and plywood are all toxic to rabbits.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #3 (HIGH Priority)

The third highest priority is to make sure the size is reasonable for the rabbits, they are not too big or small.

This ties to our research because they can't stay in a small area because they need space to hop, stretch and run. Lack of movement leads to obesity, weak bones, and foot sores. For a bigger area if it is a large, unfenced area can make them feel exposed and vulnerable to predators, causing constant stress.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #4 (HIGH Priority)

Write out this design requirement in a single sentence, ensuring that it is clear, detailed, and measurable. The fourth highest priority is making sure we can see the rabbit and what it's doing all the time.

The fourth highest priority is that the open space is too much for them and they will feel stressed. It also improves their welfare by allowing them to see their surroundings, reducing stress for these naturally vigilant prey animals.

This ties to our research because the space can make them scared of what is in the cage, making them hide and run frantically until they are exhausted or if they find that they are alone and safe.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #5 (HIGH Priority)

The fifth highest priority is making sure there's no sharp objects in the material that we are using that could harm the rabbit.

This ties to our research Because the sharp objects can hurt the rabbit and the injury can get infected and kill the rabbit

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #6 (LOW Priority)

The rabbit needs some stuff for it to enjoy its environment like toys for it to not chew other things and places for it to relieve him/her self.

This ties to our research because it gives the rabbit something to do to prevent the animal from chewing the wood or other stuff that can harm the animal.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #7 (LOW Priority)

We need bedding and places for the rabbit to sleep and exercise. The rabbit needs a safe place to sleep and a place to stretch and hop around.

This ties to our research because It helps the rabbit stay safe and keep it energized and comfortable in its environment.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.
