Element C: Presentation and Justification of Solution Design Requirements

Design Requirement #1 (fun and complex)

For this requirement we need a fun/complex area for the rabbits because they need an area to play that gets their energy out but we also want them to enjoy it and not just sit there..

Explain how this design requirement directly ties to your prior research. According to research I have done, rabbits need an area to play/workout in order to keep themselves in good health

<https://thelittlestlivesrescue.org.uk/why-do-bunnies-need-so-much-space/>

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #2 (lightweight)

Write out this design requirement in a single sentence, ensuring that it is clear, detailed, and measurable.

For this requirement it would be easy to move the shelter from place to place if it was lightweight. The Piedmont wildlife center specifically asked for it to be lightweight so this could affect the whole project.

Explain how this design requirement directly ties to your prior research.

Some of the staff at the piedmont wildlife center might not be able to carry something heavy so this requirement will absolutely help them.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #3 (easy to clean out)

For this requirement we need an easy to clean out area because rabbits can get very messy in a short amount of time and that means a lot more cleaning. They could also be exposed to some chemical products so it is a must to make the design easy to clean out.

Explain how this design requirement directly ties to your prior research.

A rabbit can eat unlimited amounts of hay and grass and poops 200-300 droppings a day so you need to clean it around 1-2 times a day with deep cleaning it around every 1-3

days. <https://kavee.com/blogs/the-bunny-blog/keep-your-rabbit-cage-clean>

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #4 (materials)

Write out this design requirement in a single sentence, ensuring that it is clear, detailed, and measurable.

The material that the shelter will be made out of could affect the rabbits health. For example, some materials might expose some toxic chemicals to make the rabbits sick. Rabbits also like to chew a lot so we need a material like bamboo that is supportive, edible, and safe for them

Explain how this design requirement directly ties to your prior research.

Bamboo is an excellent, sustainable, and cost-effective material for building rabbit shelters, as it provides a sturdy, natural, and safe environment that rabbits enjoy. Research indicates bamboo hutches can serve as durable alternatives to wire mesh, offering good ventilation, though it requires careful selection to ensure it is not treated with toxic chemicals.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #5 (not having sharp edges)

Write out this design requirement in a single sentence, ensuring that it is clear, detailed, and measurable. *We should minimize sharp edges because rabbits could easily injure themselves on it and on many occasions rabbits have been known to do self harm.*

Explain how this design requirement directly ties to your prior research. *According to this article rabbits have and can harm themselves in many different ways. https://www.medirabbit.com/EN/Skin_diseases/Mechanical/Mutilation/Selfmutilation.htm*

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #6 (disassemble and assemble back)

It would be able to carry the shelter if it was able to be disassembled or assembled. It would also be easy to clean it out by disassembling it .

A rabbit shelter that can be disassembled and reassembled offers significant benefits in terms of hygiene, transportability, and flexibility. This modular design is particularly useful for pet owners needing to manage space, move their rabbits, or maintain a strict cleaning regimen to prevent disease

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

Design Requirement #7 (see through)

Write out this design requirement in a single sentence, ensuring that it is clear, detailed, and measurable.

For these requirements the rabbit spaces should be seen through so people can be able to see and watch the rabbits to thoroughly take care of them.

Explain how this design requirement directly ties to your prior research.

This design requirement directly ties to my prior research because I know rabbits are highly destructive and there's a chance they could choke. <https://www.petmd.com/rabbit/behavior/destructive-behavior-rabbits>

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.
