

Element C:

1. Type of material the structure is built with.

This is a very high priority because we need to make sure that if the rabbits chew on any part of the structure that it is safe for them so they don't get hurt and aren't putting in any harmful stuff in their bodies.

2. Safety (no hinges or sharp edges and things inside the enclosure)

This is a high priority because we need to make sure that the rabbits can run around the enclosure without its feet getting cut up or any part of their body hurt. This could also be a hazard to the workers as they could also get hurt trying to access the rabbits.

3. How much airflow is getting into the structure.

Proper ventilation and large airflow is important because rabbits are extremely sensitive to heat and ammonia built up

4. How easy it is to clean.

The hygiene and the ease of cleaning the enclosure is very important because a dirty hutch can get unsafe very quickly and the rabbit won't be able to live there anymore because of the mess and smell.

5. How much you can see the rabbit

Because we want visitors to see the rabbits inside the enclosure and we also want the workers to access them easily without too much of a hassle.

6. Storage features

This is a low priority because you can have optional storage features like shelves and bins, these things are just not that important and there's other things that we need to be more worried about but it still gives the rabbit stuff to do.

7. Color

This is another low priority because the color and decorative elements of the structure don't really have a reason to be there like safety because the most important part of the design is the safety of the rabbits and not the design aspect of it.
