

C1/2/3/4/5:

HIGH PRIORITY LIST

1. don't hurt the turtles in the process of adding whatever we add to the tank: hurting is disturbing their routine, physically hurting, or hurting the turtles by possibly inhibiting how the primary stakeholders care for the turtles
2. basking is vital for turtles, accessibility for the basking platform is equally as important as one of the turtles is missing claws on a fin, platform itself should possibly be 18x12 for a basic first assumption
3. cleaning the waste in the tank is important, the speed and ease of cleaning the tank is what we can improve upon
 4. platform should have the UV light beaming down on it completely all over the 18x12 area,
 5. Anything we add should be big enough to where the big turtle doesn't eat it but not big enough to where it messes with the tank and its care, for an initial assumption of size, maybe make sure everything we could possibly add to be bigger than 8x8?

C6: The primary stakeholders have previously stated a want for a bigger basking platform along with a more effective ramp for the turtles. What we are hypothetically proposing is making a more accessible ramp for the little turtle that's missing a fin, along with a bigger platform so that both turtles could fit on it. The accessible ramp would shorten the time the turtles take to go bask and the bigger platform would allow them both to go up at the same time as the turtles are quite connected to each other and don't like being apart. By staying conscious of the other variables we have we're making sure that while meeting the turtles needs we don't actively take away from anything they already had.
