Element C: Presentation and Justification of Solution Design Requirements

Design Requirement #1 Disruption/chaos (HIGH Priority)

The contraption must not be loud or require a lot of movement from the user in order to respect the quiet policy commonly found in libraries.

This requirement is based on learning from the librarian herself that it is important to maintain minimal distractions to ensure that the library continues to be a place where people can come to concentrate and work. Because this contraption will be located within the library, it must have an element of uniqueness while maintaining minimal noise or physical distractions.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

N/A

Design Requirement #2 Durability (HIGH Priority)

In the scenario that the contraption gets knocked onto the floor, it must be durable and not break into several pieces.

After hearing from the librarian, we began to realize the importance of durability, especially considering that several already-built models found online used glass canisters to store the votes. During our design phase, we must take great precautions to ensure that the device will not shatter upon impact, the electronics or internal workings stay intact, and that the device itself does not become dangerous in this eventuality.

Design Requirement #3 Easy to operate (HIGH Priority)

The contraption must be both easy to maintain for the librarian and offer a friendly user experience for the younger students who use it.

The librarian mentioned that she would like to be able to easily swap out the “this or that” prompt every week and also have access to the pom-poms (voting utensil) so she could repurpose them for later use. Additionally, she also talked about how she would prefer that the contraption only requires very few actions from the user. Considering that in previous designs found on the internet the user places an item within a jar to cast the vote, it is important to strike a balance between not too complex and still engaging and fun to use.

Design Requirement #4 getting out pom-poms w/ ease (HIGH Priority)

The device should have a mechanism that allows the students to reuse the pom-poms as well as one that allows the teacher to have quick access to the pom-pom storage compartment.

During the librarian visit, she brought to our attention the need to be able to easily extract the pom-poms out of the contraption. Based on our research, we were able to come across various contraptions that were either a jar or as a card game format. However, we may end up creating an entirely different concept that has more complex mechanisms.

Design Requirement Smaller 11x18 #5 (LOW Priority)

The design must be smaller than 11x18 in order to fit in its predetermined location within the library.

The librarian specified that she would like the design to be less than 11x18". Considering that there is a large range to work with, our team regarded this as a lower priority.

Share this design requirement with (a) primary stakeholder(s) to get their validation. Share any feedback, notes, and/or your revisions as evidence that you conducted primary stakeholder validation.

N/A

Design Requirement #6 Ability to change the prompt (LOW Priority)

The librarian should be able to change the Canva graphic representing the prompt every week.

The librarian shared with us how she would like to use canva to design the prompts. She also highlighted the importance of being able to easily change the prompt on a weekly basis. Considering the majority of the "this or that" games on the market only have words to discern between the two options, we will have to be innovative with this requirement.
