

When designing the outline for our project, we had to set certain requirements that we would meet over the weeks.

One of our first requirements was to be within budget. We searched for the general price of the material and had an idea that it would cost around \$1,000. This includes the wood for the benches, slabs, or materials to make them, and the flowers.

- We then met with Mr Sethi to formally ask for this budget, he gave us one of 750\$ expandable up to 1,000.

Another requirement is that the flower area needs to be eco-friendly. To make sure:

- One, the plants aren't invasive and harm other nearby plants/vegetation
- Two, that this is the proper environment to have an ecosystem such as the one that we have planned
 - This includes how well they can live in DC weather and the interaction between them and animals/pollinators.

Also, since this is an addition, it has to be easy to maintain. This would be done by the DCI or students who would do community service hours. We were thinking of passing it down to the "Environmental Science Club".

The area would also need to have a certain representation of DCI. This could be something like using our school's color palette(white, blue) or having our slabs spell out DCI. We decided to go with the last idea and planned accordingly. Lastly, we would want to have a seating area to add certain functionality. On behalf of other of our stakeholders, they commented on the "blandness" and "lack of use" of the green area up front, which would show our solution is targeting issues but also trying to avoid what negative effects it may have. This mostly involves thinking about maintenance.
