The new rabbit hutch design at Piedmont Wildlife Center needs to fulfill multiple essential requirements which will benefit both animal welfare standards and staff operational requirements. The hutch needs to enable staff members to disassemble and reassemble the structure which will make it easy to move and clean the entire building. The hutch needs to be constructed from lightweight materials which create small parts that can be moved while using wheels to improve transportation capability. The hutch needs two different climbing areas which will allow the rabbits to explore their living space because enrichment activities are essential for their development. The design needs to provide staff members with permanent access to observation points which enable them to monitor rabbit activity throughout the facility. The hutch needs to include a specific area which allows rabbits to sleep because this space needs to provide them with a dark and concealed area for safe resting. The design requirements which follow need two design elements because they require non-toxic materials which rabbits will chew and they need to build a spacious hutch which fits their center space. The design criteria for the hutch will create a safe space which supports both safe staff operations and natural rabbit behavior.
